

Equinox - Brisbane Boys' College

Standard soccer

Lessons Learned:

1. To check your code for mathematical errors
2. Clean up code to check for errors
3. Lower acceleration to prevent breaking motors
4. Account for other variables when tuning (e.g. different field, low battery brick...)

Interesting / Innovative Feature:

The most innovative / interesting feature of our robot is our goal tracking code. This code takes the side-wall distance and through an equation gives us degree that we add to the bearing. This code accounts for intercept in the ultrasonics path as well as outliers in the reading. This allows our robot to successfully face towards the goal and goal track effectively.

The Challenge:

One of the biggest challenges we faced was a problem with our defensive charging. The problem was that the requirements for our robot was too broad and the readings from the sensors were inaccurate at further distances. We fixed this by specifying some requirements and removing others. Ultimately this has fixed our defensive robot and has allowed for it to transition to attack as a side benefit.
